

Ledger infrastructure for modern applications

Cryptographically secure | Built for developers | Run in the cloud

What is Sequence?

Sequence is a system of record for managing balances in applications. Sequence makes it incredibly easy to build, operate, and scale forward-thinking software products that need a highly available, secure, and extensible ledger at their core.

Who is Sequence for?

Sequence is for software teams that want to focus on shipping their product instead of building and maintaining ledger infrastructure. For example:

- A ride sharing app to store driver balances
- A processor to track merchant payments
- A crypto exchange to custody client funds
- A lender to manage loan lifecycle
- A VoIP platform to track prepaid minutes

What makes Sequence unique?

Each ledger in Sequence is an append-only data structure with cryptographic security end-to-end so multiple users, services, and organizations can transact and query without compromising ledger integrity.
